

## Webinar Slides

### Virtual Grand Rounds: Post-Acute COVID Syndrome – In it for the Long Haul?

#### Overview

Our goal for this session is that you will be able to:

- Define post-acute COVID syndrome and summarize the current state of knowledge on this syndrome.
- Discuss the multi-symptom nature of this syndrome and consider strategies to diagnose and follow patients with prolonged symptoms attributed to COVID-19.
- Care for and counsel patients who experience prolonged symptoms of COVID-19.

These webinars will be available for on-demand playback at [cmadocs.org/webinars](https://cmadocs.org/webinars) and [covidroundsca.org](https://covidroundsca.org)

## Agenda

- **Post-Acute Sequelae of COVID-19 (PASC) from the Bench to the Bedside.**
  - Michael Peluso, M.D., MPhil, MHS, DTM&H.
  - Lekshmi Santhosh, M.D., MA.Ed.
- **COVID-19 California Epidemiology and Vaccine Update**
  - Erica Pan, M.D., MPH
- Q&A

3

## Continuing Medical Education (CME) Offered

Learning Objectives:

- Define post-acute COVID syndrome and summarize the current state of knowledge on this syndrome.
- Discuss the multi-symptom nature of this syndrome and consider strategies to diagnose and follow patients with prolonged symptoms attributed to COVID-19.
- Care for and counsel patients who experience prolonged symptoms of COVID-19.

8

## Disclosures

**We have no disclosures to report.**

9

9

## Learning Objectives

**By the end of this talk, you will be able to:**

- **Discuss the different definitions & epidemiology of PASC (post-acute sequelae of COVID-19)**
- **Discuss possible biological mechanisms associated w/ PASC**
- **Discuss treatment strategies for patients w/ PASC done in post-COVID clinics**

10

10

# Case Definitions & Epidemiology

11

## The scale of the SARS-CoV-2 pandemic is tremendous

As of April 12, 2021:

			
Globally	136 million cases	2.94 million deaths	>130 million recovered
U.S.	31.2 million cases	562 thousand deaths	>30 million recovered

But not all COVID-19 recovery is the same

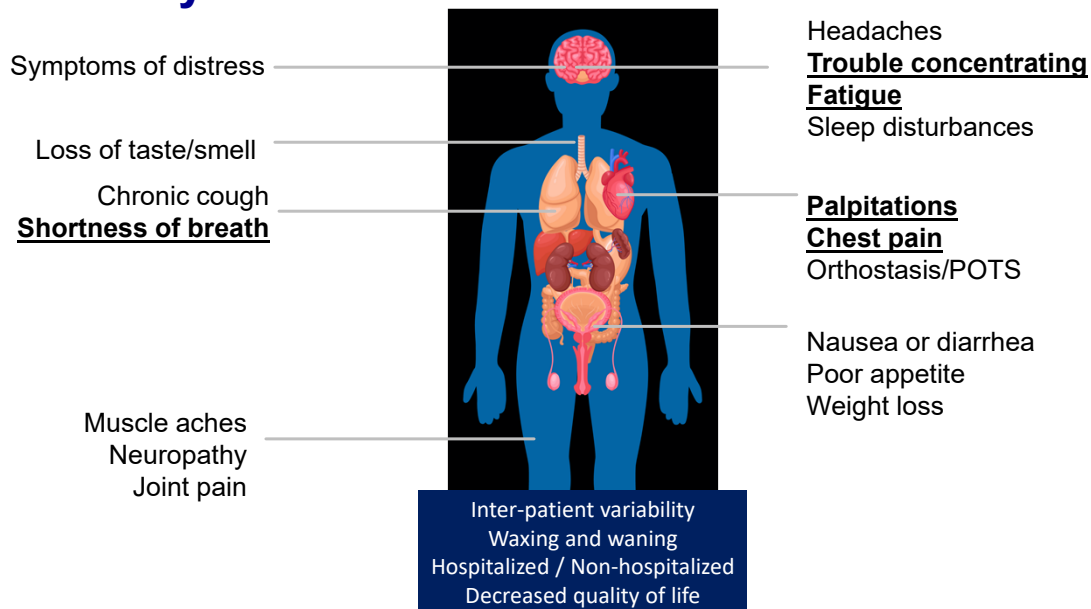

12

# COVID-19 has multi-system effects during the acute phase

13

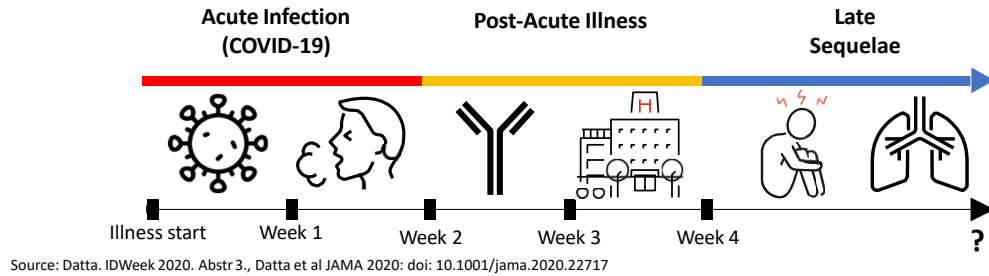

# It is now clear that there is variability in COVID-19 recovery as well

14

14

# Timeline of SARS-CoV-2 Infection and Sequelae

**For many people, COVID is not just a 10 to 14 day illness**

Many notable efforts at UCSF, including:  
 Post-COVID clinics at UCSF/SFGH (OPTIMAL), PRIORITY study (pregnant/postpartum women and their newborns)

15

15

# Symptoms Not Necessarily = Organ Dysfunction

Amenta OFID 2020

16

## Key Question 1: How should PASC be defined?

- Currently, there is no accepted case definition for PASC
- What symptoms should be included?
  - Is someone with fatigue + cognitive issues the same as someone with GI issues or cardiopulmonary issues?
- What signs/objective findings should be included?
  - Are symptoms sufficient?
  - Are objective findings necessary? What if there are objective findings without symptoms?
- On what time-scale?
  - 3 weeks? Most people will get better.
  - 3 months? Some people could still get better.

17

17

## Reports of post-acute symptoms in hospitalized and non-hospitalized patients emerged early in the pandemic

### **The emerging long-term complications of Covid-19, explained**

"It is a true roller coaster of symptoms and severities, with each new day offering many unknowns."

By Lois Parshtley | May 8, 2020, 1:10pm EDT

## The New York Times

### *Surviving Covid-19 May Not Feel Like Recovery for Some*

Debilitating symptoms can last long after a person's body has gotten rid of the coronavirus, a reality Italians are now confronting.

PRESS PLAY WITH MADELEINE BRAND

### **Think COVID-19 lasts 2 weeks? This patient has been suffering for months**

Hosted by Madeleine Brand • Jul. 24, 2020 CORONAVIRUS

18

18

## More recently, these observations have been confirmed in the scientific literature

Prevalence of ongoing symptoms following coronavirus (COVID-19) infection in the UK: 1 April 2021

- Using population survey and NHS data (20,000 participants):
  - 13.7% experienced symptoms beyond 12 weeks

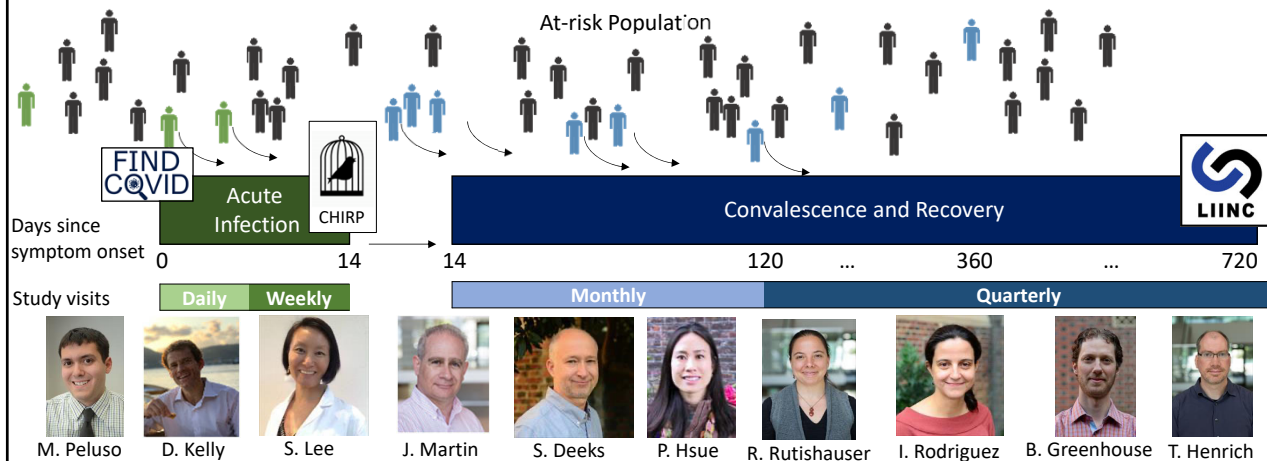

Attributes and predictors of long COVID

- 4182 incident cases (no prior issues)
  - Symptoms > 4 weeks: 13.3%
  - Symptoms > 8 weeks: 4.5%
  - Symptoms > 12 weeks: 2.3%

19

19

## The LIINC study investigates COVID sequelae

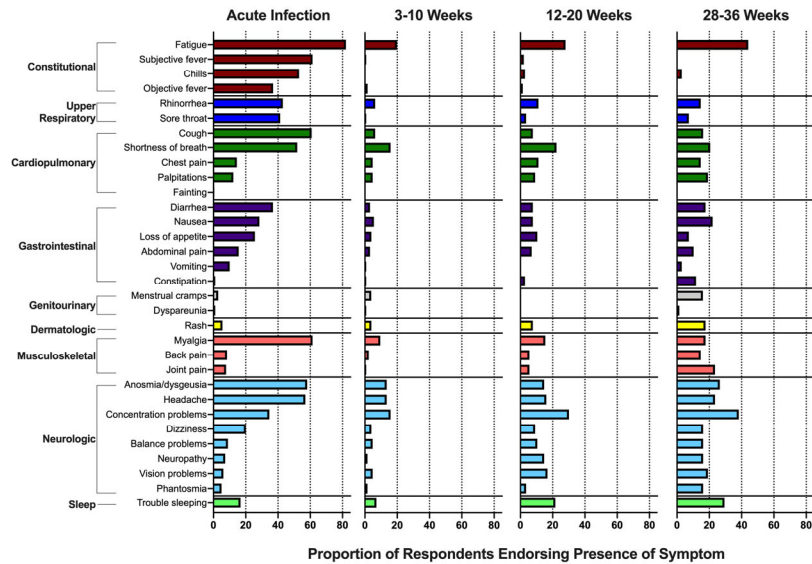

Many key partners: IRB, Dept of Medicine, ID Divisions across hospitals, Div Exp Med, DPH, CTSI

300+ enrolled (~130 with PASC) and deeply phenotyped, many now with ~1 year of follow-up; thousands of samples collected and distributed

20

## Many LIINC participants have persistent symptoms not present prior to acquiring COVID-19

medRxiv  
 Rapid implementation of a cohort for the study of post-acute sequelae of SARS-CoV-2 infection/COVID-19

21

## There appears to be a small but significant effect on quality of life

Quality of Life Domain	Response	Before illness (n=92)	Worst Point (n=179)	Week 16 (n=117)	Week 32 (n=66)
<b>Mobility</b> "Which of the best describes your ability to walk about?"	No problems	91%	39%	85%	77%
	Slight problems	6.0%	10%	9.0%	11%
	Moderate problems	2.0%	29%	4.0%	8.0%
	Severe problems	0%	4.0%	1.0%	4.0%
	Unable to walk	1.0%	18%	0.0%	0.0%
<b>Self-care</b> "Which of the following describes your ability to wash and dress yourself?"	No problems	95%	60%	96%	90%
	Slight problems	1.0%	6.5%	1.0%	6.0%
	Moderate problems	4.0%	17%	2.0%	4.0%
	Severe problems	0%	1.5%	1.0%	0%
	Unable to wash or dress	0%	15%	0%	0%
<b>Usual activities</b> "Which of the following describes your ability to perform your usual activities?"	No problems	95%	31%	81%	77%
	Slight problems	2.0%	11%	11%	14%
	Moderate problems	1.0%	23%	6.0%	1.0%
	Severe problems	2.0%	7.0%	2.0%	5.0%
	Unable to do usual activities	0%	28%	0%	3.0%
<b>Pain/discomfort</b> "Which of the following describes how much pain or discomfort you felt?"	No pain or discomfort	70%	27%	65%	52%
	Slight pain or discomfort	20%	13%	14%	26%
	Moderate pain or discomfort	7.0%	26%	17%	15%
	Severe pain or discomfort	3.0%	24%	3.0%	2.0%
	Extreme pain or discomfort	0%	10%	1.0%	5.0%
<b>Anxiety/depression</b> "Which of the following describes how anxious or depressed you felt?"	No anxiety or depression	51%	18%	48%	43%
	Slight anxiety or depression	27%	23%	31%	32%
	Moderate anxiety or depression	17%	24%	15%	14%
	Severe anxiety or depression	2.0%	17%	4.0%	6.0%
	Extreme anxiety or depression	3.0%	18%	2.0%	5.0%

Severe symptomology occurs and persists, but is uncommon

22

## LIINC: Mental health assessments

Mental Health Symptoms and Severity	Week 16 (n = 119)*	Week 32 (n = 65)*
Symptoms of anxiety (GAD-7 total score) †		
Minimal (0 to 4)	68 (44%)	33 (51%)
Mild (5 to 9)	86 (56%)	32 (49%)
Moderate (10 to 14)	0 (0%)	0 (0%)
Severe (15 to 21)	0 (0%)	0 (0%)
Symptoms of depression (PHQ-8 total score) †		
None (0 to 4)	70 (54%)	39 (54%)
Mild (5 to 9)	19 (17%)	12 (20%)
Moderate (10 to 14)	13 (12%)	5 (8.0%)
Moderately severe (15 to 19)	4 (3.5%)	3 (5.0%)
Severe (20 to 24)	4 (3.5%)	2 (3.0%)
Symptoms of post-traumatic stress disorder (PCL-5 total score) †, §		
Score ≥ 10	6 (6.0%)	7 (11%)

Post-COVID symptoms of distress are common

23

## Evidence of organ system abnormalities in late recovery

Persistent COVID-19-associated neurocognitive symptoms  
In non-hospitalized patients

First report of persistent neurocognitive symptoms; impetus for Coronavirus Neurocognitive Study (CNS, PI: J. Hellmuth)

THE LANCET

6-month consequences of COVID-19 in patients discharged  
from hospital: a cohort study

Persistent symptoms associated with abnormal chest imaging; now working to characterize  
pulmonary recovery (PI: L. Huang)

JAMA Cardiology

Outcomes of Cardiovascular Magnetic Resonance Imaging in Patients  
Recently Recovered From Coronavirus Disease 2019 (COVID-19)

High proportion of abnormal cardiac MRI findings; impetus for Cardiovascular Impact Study  
(PI: P. Hsue)

Efforts now underway to deeply characterize PASC,  
there might be several different “phenotypes” of PASC

24

## Key Question 1: How should PASC be defined?

Cardiovascular Impact Study  
(P. Hsue, M. Durstenfeld)

Pulmonary Recovery Study  
(L. Huang)

Coronavirus Neurocognitive Study  
(J. Hellmuth, F. Chow, M. Greene)

No agreed upon definition.  
There might be several different “phenotypes” of PASC.

25

25

## Key Question 2: How common is PASC?

- Prevalence of 2-90% has been reported
- Most study populations not representative:
  - Are people who are not feeling well motivated to enroll (over-represented)?
  - Are people who are not feeling well too disabled to participate (under-represented)?

No one knows. But even if uncommon (<5%),  
the sheer numbers are problematic (5% of 30M is 1.5M).

26

26

## Key Question 3: Who gets PASC?

- Determining who may develop PASC can guide care and research

Attributes and predictors of long COVID

Prevalence of ongoing symptoms following coronavirus (COVID-19) infection in the UK:

- Increasing age (up to 70)
- Increasing BMI
- Female sex
- >5 symptoms during first week of illness
- Pre-existing, activity-limiting conditions
- Lower socioeconomic status

Predictors of clinical symptoms, objective findings, and symptom trajectory will all need to be identified.

27

27

# Biology of PASC

28

# Key Question 4: What is the biology of PASC?

Artwork: Shirley Shao, UCSF MS2

Studies like LIINC are well-positioned to answer these questions

## SARS-CoV-2 persists in gut tissue for > 6 months

### Evolution of antibody immunity to SARS-CoV-2

34

34

# Management of PASC

35

## Key Question 5: How do we manage PASC?

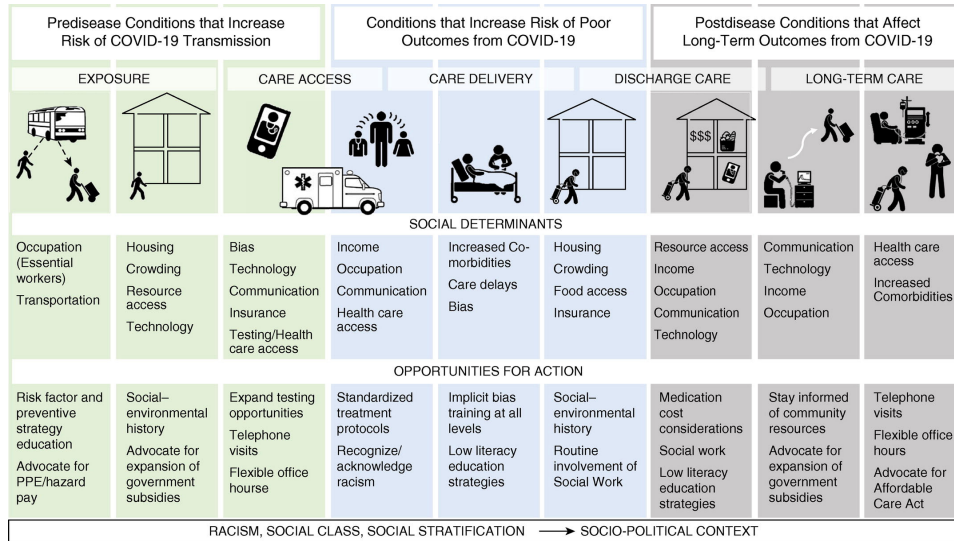

- Will new preventative (vaccines) or therapeutic (monoclonal antibodies) interventions change the incidence of PASC?
- Do certain interventions help patients manage PASC symptoms?
- Do certain interventions treat PASC and cause it to resolve?

There is an urgent need for interventional studies, which may also help to define the underlying biology.

36

36

# There are several early studies suggesting disparities in PASC

Thakur AIRCCM 2020

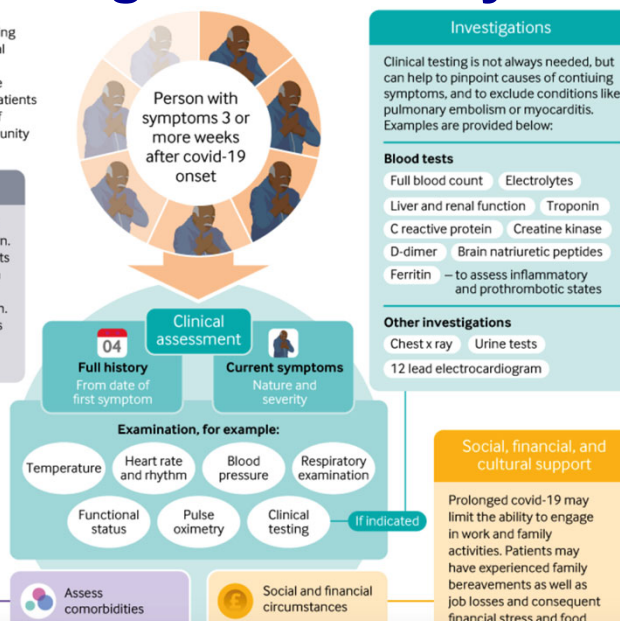

37

# What do the guidelines say? BMJ Recs

Post-acute covid-19 appears to be a multi-system disease, sometimes occurring after a relatively mild acute illness. Clinical management requires a whole-patient perspective. This graphic summarises the assessment and initial management of patients with delayed recovery from an episode of covid-19 that was managed in the community or in a standard hospital ward.

**An uncertain picture**  
The long term course of covid-19 is unknown. This graphic presents an approach based on evidence available at the time of publication. However, caution is advised, as patients may present atypically, and new treatments are likely to emerge

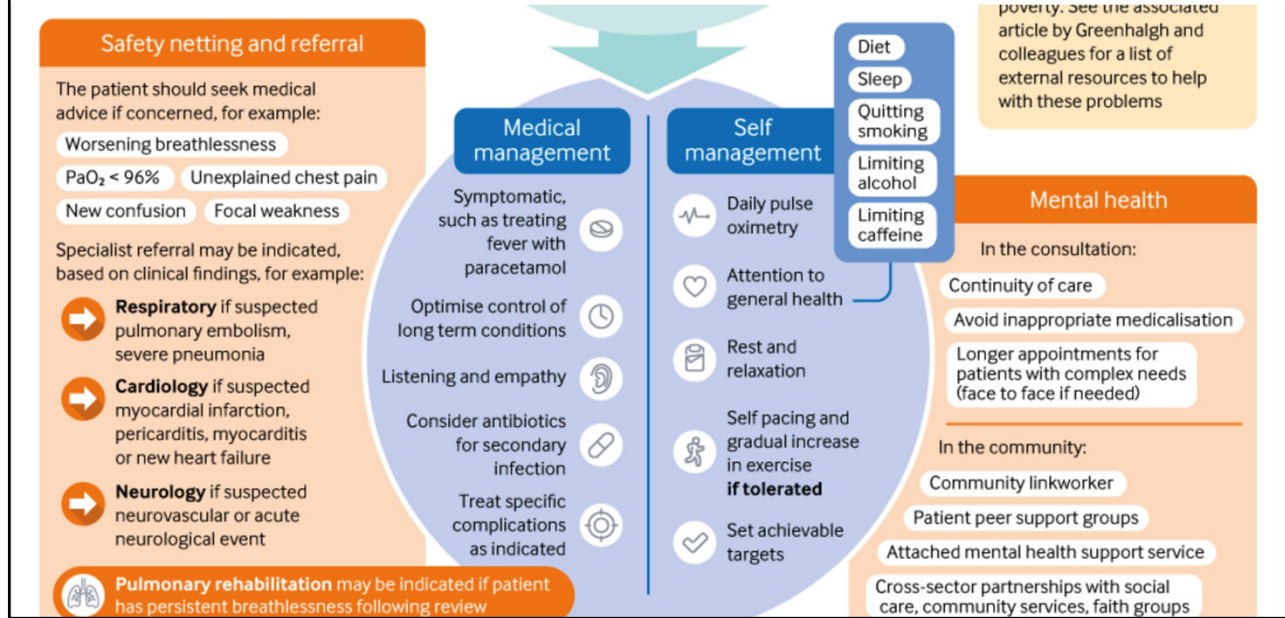

**Managing comorbidities**  
Many patients have comorbidities including diabetes, hypertension, kidney disease or ischaemic heart disease. These need to be managed in conjunction with covid-19 treatment. Refer to condition specific guidance, available in the associated article by Greenhalgh and colleagues

Greenhalgh BMJ 2020

## ATS/ERJ Recs: More Research Qs than As!

The Task Force identified the following research needs for previously hospitalized patients with COVID-19 pneumonia who were discharged in the past 30–60 days

### Routine testing to establish a new baseline?

Pulmonary function testing

6-min walk test

Computed tomography of the chest

Transthoracic echocardiography

### Routine screening for:

Cognitive impairment

Depression

Anxiety & PTSD

Post-traumatic stress disorder

Bai Eur Resp Review 2020

41

## ATS/ERJ Recs: More Research Qs than As!

Continue prophylactic anticoagulant therapy as outpatients until the D-dimer normalises?

Serological testing to assess immune response to the infection?

Attending medical visits without screening for active infection if serological tests positive?

Serological testing of household contacts to determine if mild or asymptomatic infection?

Referral to a multidisciplinary clinic for post-intensive care syndrome?

Referral to pulmonary rehabilitation regardless of lung function?

Routine referral for mental health counselling?

Bai Eur Resp Review 2020

42

## One of my patients: from COVID ICU to post-COVID Clinic

Mrs. L is an 83-year-old Spanish-speaking woman recently discharged following hospitalization for COVID-19 pneumonia. She has T2DM, HTN, and hearing loss. She lives with her daughter, who is her DPOA.

She is discharged to subacute rehab at a local skilled nursing facility.

During hospitalization she required HFNC in the ICU. She is discharged home on room air, yet remains breathless, anxious, and socially isolated.

43

## Ambulatory Follow-Up for COVID-19: The OPTIMAL Clinic (pOst-covid/PosT-Icu MultidisciplinAry cLinic)

- ❑ New at UCSF - Multidisciplinary Clinic b/w Pulm, Geriatrics, Psych, Integrative Medicine, & partnerships with Cardiology, Neurology
- ❑ Integrated clinical follow-up and research arms
- ❑ Will see patients ~4 weeks post-discharge (virtual visit), 3 month, 6 month, 9 month, 12 months post-discharge
- ❑ Please refer any pts who were admitted to the ward or ICU w/ COVID

[ Critical Care Original Research ]

## Fatigue Symptoms During the First Year Following ARDS

Karin J. Neufeld, MD, MPH; Jeanine-Marie S. Leoutsakos, PhD, MHS; Huijuan Yan, PhD; Shihong Lin, MS; Jeffrey S. Zabinski, MD; Victor D. Dinglas, MPH; Megan M. Hossey, PhD; Ann M. Parker, MD; Ramona O. Hopkins, PhD; and Dale M. Needham, MD, PhD

**BACKGROUND:** Fatigue is commonly reported by ARDS survivors, but empirical data are scarce.

**RESEARCH QUESTION:** This study evaluated fatigue prevalence and associated variables in a prospective study of ARDS survivors.

**STUDY DESIGN AND METHODS:** This analysis is part of the ARDSNet Long-Term Outcomes Study (ALITOS) conducted at 38 US hospitals. Using age- and sex-adjusted, time-averaged random effects regression models, we evaluated associations between the validated Functional Assessment of Chronic Illness Therapy-Fatigue Scale with patient and critical illness variables, and with physical, cognitive, and mental health status at 6 and 12 months following ARDS.

**RESULTS:** Among ARDS survivors, 501 of 711 (70%) and 436 of 659 (66%) reported clinically significant symptoms of fatigue at 6 and 12 months, respectively, with 41% and 28% reporting clinically important improvement and worsening (n = 638). At 6 months, the prevalence of fatigue (70%) was greater than that of impaired physical functioning (50%), anxiety (42%), and depression (36%); 46% reported both impaired physical function and fatigue, and 27% reported co-existing anxiety, depression, and fatigue. Fatigue was less severe in men and in those employed prior to ARDS. Critical illness variables (eg, illness severity, length of stay) had little association with fatigue symptoms. Worse physical, cognitive, and mental health symptoms were associated with greater fatigue at both the 6- and 12-month follow-up.

**INTERPRETATION:** During the first year following ARDS, more than two-thirds of survivors reported clinically significant fatigue symptoms. Due to frequent co-occurrence, clinicians should evaluate and manage survivors' physical, cognitive, and mental health status when fatigue is endorsed.

CHEST 2020; 158(3):999-1007

## Depression, Cog Issues & Disability Intertwined

59

## COVID is a “Delirium Factory” – Dr. Wes Ely

The New York Times Account

***‘They Want to Kill Me’: Many Covid Patients Have Terrifying Delirium***

Paranoid hallucinations plague many coronavirus patients in I.C.U.s, an experience that can slow recovery and increase risk of depression and cognitive issues.

60

## COVID Recovery Resources: Power of AVS

- **Mental Health:** Reassurance and coping strategies are key, peer support, assess for psych referral/needs for meds
- **Social Isolation/Loneliness:** Older adults and those with many medical problems are at particular risk. Discuss safe socialization and IADL logistics

Perissinotto Archives 2012

61

## One Key Point

All that “Long-Hauls” is not  
COVID.

Avoid anchoring & keep  
ddx broad throughout.

62

### One of my Patients: From COVID ICU to Post-COVID Clinic

During our OPTIMAL Clinic visit, we assessed Mrs. L & counseled her and her daughter about anticipated recovery. We recommended gradual aerobic exercise, using a home pulse oximeter, & consideration of PRN inhalers. The integrated mental health support of the visit greatly alleviated the patient's stresses & she "felt a lot better after talking to them." We provided reassurance & recommendations for local resources & set f/u appointment for 3 months.

63

## Take Home Points

- COVID long-term symptoms & complications can affect **multiple organs**
- The **biological basis** of PASC is under investigation in multiple organ systems
- A comprehensive **multidisciplinary** approach is important to address disability, fatigue, neuropsych symptoms
- Lots of **uncertainty** remains & further research will help outline best next steps

64

# Vaccine Equity Metric

This graph compares COVID-19 vaccinations among four different levels of community health.

It uses [Healthy Places Index \(HPI\)](#)\* measures in a zip code area that can impact health, like income, education, and access to health care. Areas are then given a score, ranging from least healthy community conditions (Quartile 1) to most healthy community conditions (Quartile 4).

The Vaccine Equity Metric also creates scores for areas that don't have an HPI score.

\*A project of the Public Health Alliance of Southern California ([PHASC](#))

Updated April 12, 2021 with data from April 11, 2021. "Partially vaccinated" represents individuals who have received only one dose of the Pfizer or Moderna vaccine. "Fully vaccinated" represents individuals who have received two doses of the Pfizer or Moderna vaccine, or one dose of the Janssen vaccine. Percentage for number of people calculated as people vaccinated in a quartile divided by population of people 16 years of age and over in a quartile.

Posted 3/17/21 [Vaccines - Coronavirus COVID-19 Response \(ca.gov\)](#)

77

77

# Vaccine Equity Metric

This graph shows the percent of people vaccinated by Vaccine Equity Metric quartile each week. It shows that, while administration rates in quartiles 1 and 2 have improved, there is still work to be done.

\* 3/2: Allocated more vaccines to lowest quartile  
 \*\* 3/15: Started vaccinating individuals at higher risk

Data: 4/6/2021 11:59PM | Posted: 4/7/2021

Posted 3/17/21 [Vaccines - Coronavirus COVID-19 Response \(ca.gov\)](#)

78

78

## Who Can Get Vaccinated?

### Eligible Groups

- Health care workers
- Long term care and skilled nursing facility residents
- Californians 65 years and older
- Food and agriculture
- Childcare and education
- Emergency responders
- Those in high-risk congregate living spaces
- Certain public transit workers

As of **March 15**, healthcare providers may use their clinical judgement to vaccinate individuals aged 16-64 who are deemed to be at the very highest risk to get very sick from COVID-19:

- Severe health conditions
- Disabilities or illness

As of **April 1**, Individuals 50 or older

Starting **April 15**, Every Californian 16 or older

79

79

## Fully Vaccinated Guidance

- Fully vaccinated people can:
  - Visit the private households of other fully vaccinated people indoors without wearing masks or physical distancing.
  - Visit with unvaccinated people from a single household who are at low risk for severe COVID-19 disease indoors without wearing masks or physical distancing.
  - Refrain from quarantine following a known exposure if asymptomatic.

80

## Vaccine Verification – Capacity Increases

Fully vaccinated or tested negative attendees **only**:

For further increased numbers of guests, venues can establish vaccinated-only sections with no distancing requirements.

Tier 1 Widespread	Tier 2 Substantial	Tier 3 Moderate	Tier 4 Minimal
Existing capacity limits apply	Existing capacity limits apply	Outdoor: Existing capacity limits apply  Indoor: Venues may increase capacity by an additional 50%, up to a maximum of 50% of total venue capacity.	Outdoor: Existing capacity limits apply  Indoor: Venues may increase capacity by an additional 50%, up to a maximum of 75% of total venue.

81

## Vaccine Verification

The following are acceptable as proof of full vaccination:

- Vaccination card (which includes name of person vaccinated, type of vaccine provided, and date last dose administered), OR
- A photo of a vaccination card as a separate document, OR
- A photo of the attendee's vaccine card stored on a phone or electronic device, OR
- Documentation of vaccination from a healthcare provider.

82

## Vaccine Update – J&J Pause

### Joint CDC and FDA Statement on Johnson & Johnson COVID-19 Vaccine

The following statement is attributed to Dr. Anne Schuchat, Principal Deputy Director of the CDC and Dr. Peter Marks, director of the FDA's Center for Biologics Evaluation and Research

[Español \(Spanish\)](#)

#### Media Statement

For Immediate Release: Tuesday, April 13, 2021

Contact: [Media Relations](#)  
(404) 639-3286

As of April 12, more than 6.8 million doses of the Johnson & Johnson (Janssen ) vaccine have been administered in the U.S. CDC and FDA are reviewing data involving six reported U.S. cases of a rare and severe type of blood clot in individuals after receiving the J&J vaccine. In these cases, a type of blood clot called cerebral venous sinus thrombosis (CVST) was seen in combination with low levels of blood platelets (thrombocytopenia). All six cases occurred among women between the ages of 18 and 48, and symptoms occurred 6 to 13 days after vaccination. Treatment of this specific type of blood clot is different from the treatment that might typically be administered. Usually, an anticoagulant drug called heparin is used to treat blood clots. In this setting, administration of heparin may be dangerous, and alternative treatments need to be given.

<https://www.cdc.gov/media/releases/2021/s0413-JJ-vaccine.html>

83

## Vaccine Updates – Addressing Delaying Second Doses

- Western States Scientific Safety Review Workgroup reconvened April 8, 2021
- Modeling & projection data for delaying second doses by 2 weeks were reviewed:
  - Accelerate vaccine coverage for California by one week
  - May decrease cases if high uptake, but with NPIs and current vaccine coverage still likely lower than summer 2020 surge
- After discussing the most recent effectiveness data and evidence, the pros & cons of this new timeline with implementation and communication issues, and current levels of transmission in CA, the workgroup recommended not to increase interval to 2<sup>nd</sup> dose
- Recommendation & modeling to be further reviewed by CHHS

84

## Vaccine Updates – Pfizer Application

### Pfizer and BioNTech Request Regulatory Agencies Expand Emergency Use of Their COVID-19 Vaccine to Adolescents

**NEW YORK and MAINZ, GERMANY, April 9, 2021** — Pfizer Inc. (NYSE: PFE) and BioNTech SE (Nasdaq: BNTX) today requested amendments to the U.S. Emergency Use Authorization (EUA) of the Pfizer-BioNTech Vaccine (BNT162b2) to expand the use in adolescents 12 to 15 years of age. The companies plan to request similar rulings by other regulatory authorities worldwide in coming days. These requests are based on data from the pivotal Phase 3 trial in adolescents 12 to 15 years of age with or without prior evidence of SARS-CoV-2 infection, which demonstrated 100 percent efficacy and robust antibody response after vaccination with the COVID-19 Vaccine.

Topline results from an efficacy analysis on 12 to 15 year old participants through cases accrued by March 31, 2021 from the Phase 3 trial were recently announced. In this analysis, BNT162b2 was well tolerated with side effects generally consistent with those observed in participants 16 to 25 years of age. All participants in the trial will continue to be monitored for long-term protection and safety for an additional two years after their second dose.

- 4/9 requested amendments to Emergency Use Authorization (EUA) to expand use in 12 to 15yo.
- Based on data from Phase 3 trial in this age group that demonstrated good efficacy and vaccine tolerance.

85

## Possible Long Term CDPH COVID-19 Activities

- Exploring options for developing CA COVID-19 registry of long-term outcomes from surveillance.
- Collaborate to conduct longitudinal follow up on long term symptoms and other impacts.
- Assess and synthesize to inform economic impacts, policy and program interventions, and provide recommendations on long term recovery.

86
